

#### IV. CONCLUSION

Based on the research results conducted in designing a Blueprint enterprise architecture Smart village using the TOGAF ADM framework method. 9.2 focused on the e-government dimension by sampling villages under the Sragen Regency government with an IDM index value of  $0.7072 < \text{IDM} < 0.8155$  or villages with Advanced clustering. It can be concluded from the research output in the form of an enterprise architecture smart village blueprint that will become a guideline for the digital development design strategy reference on the e-Government dimension in the form of several application platforms covering various management of public administration services, public development aspirations, and management of village development management, as well as governance management. Manage village government documents.

In realizing the sustainability of the development of the smart village concept, by looking at the potential, needs, and characteristics of each village, the results of this study need sustainable development from various phases as a complement to subsequent research which aims to facilitate identification in each village and the suitability of the area for implementing the smart village concept.
